

The blue bin takes plasterboard. Only plasterboard.

Keep this in the gatehouse. It covers the one decision that matters: is that sheet plasterboard, or fibro?

Send it to the blue bin

- **Paper on both faces** — grey or ivory, sometimes with a maker's name on the back
- **Chalky white or grey core** showing at cut or broken edges
- **Light for its size**; crumbly edges
- Offcuts, part sheets, whole sheets, cornice
- Standard, fire-rated and moisture-resistant board are all fine

Keep it out

- **No paper face** — hard, grey, cement-like sheet: treat as fibro, which may contain asbestos
- **Dimpled or textured back**
- From eaves, wet areas, sheds or outside walls of an older building
- Foil-backed or insulation-bonded board; lead paint
- Anything that isn't plasterboard: tiles, timber, metal, batts, rubbish

What to say

"Is any of that fibro, or from an older house?" If yes, or they don't know: **"That one can't go in the blue bin — it goes with asbestos waste."**

"Plasterboard goes in through the side panel — lift it, slide the sheets in, shut it after."

"Screws and timber out, please — it's recycled into gypsum."

Never cut, snap or sand a sheet to check it. Only a lab test confirms asbestos — follow your site's asbestos procedure for anything doubtful.
